

DBMS PROJECT PROPOSAL

Project Title	JOB PORTAL		
Abstract	<p>This project focuses on creating a job portal with a database to manage data related to job seekers, employers (companies), job postings, and applications. Employers, or companies, will be able to register, create company profiles, and post job openings with details like job title, description, required qualifications, and location. Job seekers can create profiles, upload resumes, apply for jobs, and track the status of their applications. The portal will also include a search functionality, allowing job seekers to filter job listings by various criteria such as job title, city, and salary. A city-wise search feature will help users find jobs specific to their location. The goal of this project is to build a user-friendly platform that streamlines the hiring process by connecting job seekers with companies, making it easier to post jobs, apply for them, and manage applications efficiently.</p>
